LENVIMA is a prescription medicine that is used by itself to treat DTC, a type of thyroid cancer that can no longer be treated with radioactive iodine and is progressing.

It is not known if LENVIMA is safe and effective in children.

SELECTED SAFETY INFORMATION

• LENVIMA may cause serious side effects, including high blood pressure (hypertension): High blood pressure is a common side effect of LENVIMA and can be serious. Your blood pressure should be well controlled before you start taking LENVIMA. Your health care provider should check your blood pressure regularly during treatment with LENVIMA. If you develop blood pressure problems, your health care provider may prescribe medicine to treat your high blood pressure, lower your dose of LENVIMA, or stop your treatment with LENVIMA.
Being diagnosed with cancer can be an overwhelming experience. Each stage of your disease is different. So is the treatment for it.

Because you have a type of thyroid cancer that is progressing and can no longer be treated with radioactive iodine (RAI), your doctor believes that at this stage of treatment, LENVIMA® may be right for you. You can take it at home once a day. This guide was designed to help you get started on treatment with LENVIMA.

This guide is made to help you:
• better understand this type of progressing thyroid cancer
• better understand what to expect from your treatment with LENVIMA
• learn about support that may be available to you

This guide may help you understand treatment with LENVIMA, but it does not replace talking to your doctor. If you have questions about your condition or treatment with LENVIMA, ask a member of your health care team.

This guide should only be used if you have been prescribed LENVIMA for differentiated thyroid cancer.

YOU ARE NOT ALONE. WE ARE HERE TO SUPPORT YOU.
Cancer is a disease in which cells in the body grow out of control. Cancer that starts in the thyroid gland is called thyroid cancer.

**THYROID CANCER IS MORE COMMON THAN YOU THINK...**

The number of people with thyroid cancer has tripled in the last 30 years

About 52,000 people in the United States will be diagnosed with thyroid cancer in 2019 alone

About 37,800 women  About 14,200 men

DTC can include papillary and follicular (including Hürthle cell) carcinoma. It is a type of thyroid cancer that is commonly treated with radioactive iodine (RAI) therapy. RAI works by concentrating in thyroid cells and destroying the thyroid tissue and any other thyroid cells (including cancer cells) that take up iodine. Sometimes you may no longer be able to receive RAI.

Progression is when your cancer gets worse or spreads over time. Sometimes, progression may make your symptoms feel worse, while other times you may not feel new or worsening symptoms at first. It is important to talk to your doctor so he/she can perform scans to see if your cancer is progressing.
LENVIMA is a prescription medicine that is used by itself to treat people with DTC that is progressing and can no longer be treated with RAI.

**WHAT IS LENVIMA® AND HOW IS IT THOUGHT TO WORK?**

LENVIMA is a targeted treatment. It targets certain proteins on cancer cells that cause the cells to grow and multiply. Normal cells also contain these proteins and may be affected by LENVIMA.

**HOW LENVIMA IS THOUGHT TO WORK**

- **Cells**
  LENVIMA is believed to block the signals that allow the cells (tumor and normal) to survive and multiply.

- **Blood vessels**
  LENVIMA is believed to block signals that help blood vessels grow. Blood vessels support the tumor’s survival and growth.

**HOW CAN LENVIMA HELP PATIENTS WITH DTC?**

LENVIMA was studied in a clinical trial of 392 patients with DTC that was progressing and could no longer be treated with RAI. In this trial, patients were randomly assigned to receive either LENVIMA or placebo, a pill that does not have a medical effect on the body.

- **Patients treated with LENVIMA**
  (261 patients) lived without their cancer getting worse for an average of 18.3 months (some longer and some not as long). Patients who received placebo lived without their cancer getting worse for an average of 3.6 months (some longer and some not as long).

- **Patients taking LENVIMA**
  lived without their cancer getting worse for an average of 14.7 months longer than those not taking LENVIMA.

**SELECTED SAFETY INFORMATION**

LENVIMA may cause serious side effects, including:

- **heart problems**: LENVIMA can cause serious heart problems that may lead to death. Call your health care provider right away if you get symptoms of heart problems, such as shortness of breath or swelling of your ankles.

- **problem with blood clots in your blood vessels (arteries)**: Get emergency medical help right away if you get any of the following symptoms: severe chest pain or pressure; pain in your arms, back, neck, or jaw; shortness of breath; numbness or weakness on one side of your body; trouble talking; sudden severe headache; sudden vision changes.

Please see Selected Safety Information throughout and on pages 12-15 and accompanying full Prescribing Information.
WHAT SHOULD I TELL MY HEALTH CARE TEAM BEFORE TAKING LENVIMA®?

Before you take LENVIMA, tell your health care provider about all of your medical conditions, including if you:

- have high blood pressure
- have heart problems
- have a history of blood clots in your arteries (type of blood vessel), including stroke, heart attack, or change in vision
- have or have had kidney or liver problems
- have a history of a tear (perforation) in your stomach or intestine, or an abnormal connection between two or more body parts (fistula)
- have headaches, seizures, or vision problems
- have any bleeding problems
- are pregnant or plan to become pregnant. LENVIMA can harm your unborn baby

Tell your health care provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements.

Know the medicines you take. Keep a list of your medicines to show to your health care provider and pharmacist when you get a new medicine.

HOW SHOULD I STORE LENVIMA?

Store LENVIMA at room temperature, between 68°F to 77°F (20°C to 25°C).

Keep LENVIMA and all medicines out of the reach of children.

- Be sure to store LENVIMA in a room with a steady temperature

General information about the safe and effective use of LENVIMA

Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. Do not use LENVIMA for a condition for which it was not prescribed. Do not give LENVIMA to other people, even if they have the same symptoms you have. It may harm them. You can ask your health care provider or pharmacist for information about LENVIMA that is written for health professionals.
HOW SHOULD I TAKE LENVIMA®?

Take LENVIMA exactly as your health care provider tells you to take it

LENVIMA should be taken once a day at the same time

• For example, if you take it at 1:00 PM on Monday, take it on Tuesday at 1:00 PM and so on

You can take LENVIMA with or without food

About your daily dose of LENVIMA

• Your health care provider will tell you how much LENVIMA to take and when to take it
• Your health care provider may change your dose during treatment, stop treatment for some time, or completely stop treatment with LENVIMA if you have side effects
• The standard starting dose is two 10-mg capsules and one 4-mg capsule (24 mg)

If you miss a dose of LENVIMA

• If you miss a dose of LENVIMA and it is within 12 hours of your missed dose, take it as soon as you remember
• If it is more than 12 hours after your missed dose, skip the missed dose and take the next dose at your regular time

WHAT DO LENVIMA CAPSULES LOOK LIKE?

LENVIMA comes in 10-mg and 4-mg capsules

Capsules not actual size.

IF YOU CANNOT SWALLOW LENVIMA CAPSULES WHOLE:

STEP 1. Use a medicine cup to measure about one tablespoon of water or apple juice and place into a small glass

STEP 2. Place the LENVIMA capsules into the small glass without breaking or crushing them

STEP 3. Leave the capsules in the liquid for at least 10 minutes

STEP 4. Stir the contents of the glass for at least 3 minutes. Drink the mixture

STEP 5. Rinse the glass with a small amount of additional water or apple juice and swallow the liquid

You can take LENVIMA with or without food

If you think you have taken more LENVIMA capsules than you should have, please call your health care provider or go to the nearest hospital emergency room right away.
SELECTED SAFETY INFORMATION

What are possible side effects of taking LENVIMA®?

LENVIMA may cause serious side effects, including:

- **high blood pressure (hypertension):** High blood pressure is a common side effect of LENVIMA and can be serious. Your blood pressure should be well controlled before you start taking LENVIMA. Your health care provider should check your blood pressure regularly during treatment with LENVIMA. If you develop blood pressure problems, your health care provider may prescribe medicine to treat your high blood pressure, lower your dose of LENVIMA, or stop your treatment with LENVIMA.

- **heart problems:** LENVIMA can cause serious heart problems that may lead to death. Call your health care provider right away if you get symptoms of heart problems, such as shortness of breath or swelling of your ankles.

- **problem with blood clots in your blood vessels (arteries):** Get emergency medical help right away if you get any of the following symptoms: severe chest pain or pressure; pain in your arms, back, neck, or jaw; shortness of breath; numbness or weakness on one side of your body; trouble talking; sudden severe headache; sudden vision changes.

- **liver problems:** LENVIMA may cause liver problems that may lead to liver failure and death. Your health care provider will check your liver function before and during treatment with LENVIMA. Tell your health care provider right away if you have any of the following symptoms: your skin or the white part of your eyes turns yellow (jaundice); dark, “tea-colored” urine; light-colored bowel movements (stools); feeling drowsy, confused, or loss of consciousness.

- **kidney problems:** Kidney failure, which can lead to death, has happened with LENVIMA treatment. Your health care provider should do regular blood tests to check your kidneys.

- **increased protein in your urine (proteinuria):** Proteinuria is a common side effect of LENVIMA and can be serious. Your health care provider should check your urine for protein before and during your treatment with LENVIMA. If you develop protein in your urine, your health care provider may decrease your dose of LENVIMA or stop your treatment.

- **diarrhea:** Diarrhea is a common side effect of LENVIMA and can be serious. If you get diarrhea, ask your health care provider about what medicines you can take to treat your diarrhea. It is important to drink enough water when you get diarrhea. Tell your health care provider or go to the emergency room if you are unable to drink enough liquids and your diarrhea is not able to be controlled.

- **an opening in the wall of your stomach or intestines (perforation) or an abnormal connection between two or more body parts (fistula):** Get emergency medical help right away if you have severe stomach (abdomen) pain.

- **changes in the electrical activity of your heart called QT prolongation:** QT prolongation can cause irregular heartbeats that can be life threatening. Your health care provider will do blood tests before and during your treatment with LENVIMA to check the levels of potassium, magnesium, and calcium in your blood, and may check the electrical activity of your heart with an ECG.

- **low levels of blood calcium (hypocalcemia):** Your health care provider will check your blood calcium levels during treatment with LENVIMA and may tell you to take a calcium supplement if your calcium levels are low.

- **a condition called Reversible Posterior Leukoencephalopathy Syndrome (RPLS):** Call your health care provider right away if you get severe headache, seizures, weakness, confusion, or blindness or change in vision.

- **bleeding:** LENVIMA may cause serious bleeding problems that may lead to death. Tell your health care provider if you have any signs or symptoms of bleeding during treatment with LENVIMA, including severe and persistent nose bleeds; vomiting blood; red or black (looks like tar) stools; blood in your urine; coughing up blood or blood clots; heavy or new onset vaginal bleeding.
The most common side effects of LENVIMA in people treated for thyroid cancer include:

- tiredness
- joint and muscle pain
- decreased appetite
- weight loss
- nausea
- mouth sores
- headache
- vomiting
- rash, redness, itching, or peeling of your skin on your hands and feet
- stomach (abdomen) pain
- hoarseness

LENVIMA may cause fertility problems in males and females. Talk to your health care provider if this is a concern for you.

These are not all the possible side effects of LENVIMA. Call your doctor for medical advice about side effects. You may report side effects to the FDA at 1-800-FDA-1088 or visit www.fda.gov/medwatch.

Talk to your doctor about any side effects you may experience.

What are possible side effects of taking LENVIMA®? (cont’d)

- change in thyroid hormone levels: You may have changes in your thyroid hormone levels when taking LENVIMA. Your health care provider may need to change your dose of thyroid medicine while you are taking LENVIMA. Your health care provider should check your thyroid hormone levels before starting and every month during treatment with LENVIMA.

- wound healing problems: If you need to have a surgical procedure, tell your health care provider that you are taking LENVIMA. LENVIMA should be stopped until your wound heals.
FINANCIAL SUPPORT

LEARN ABOUT $0 CO-PAY

You may be eligible for the LENVIMA® $0 Co-pay Program, which offers commercially insured patients a $0 co-pay for each prescription, with a $40,000 annual limit.‡

‡Maximum benefit and eligibility criteria: The LENVIMA $0 Co-pay Program provides up to $40,000 per year to assist with your out-of-pocket costs for LENVIMA. Depending on your insurance plan, you could have additional financial responsibility for any amounts over Eisai’s maximum liability. Not available to patients eligible for state or federal health care programs, including Medicare, Medicaid, Medigap, VA, DoD, or TRICARE. Offer only available to patients with private, commercial insurance. See www.LenvimaReimbursement.com for complete terms and conditions.

Restrictions apply.

For more information about LENVIMA financial assistance that may be available, contact your Specialty Pharmacy.

For additional assistance, contact the Eisai Assistance Program at www.LenvimaReimbursement.com or call 1-866-61-EISAI (1-866-613-4724).

THE EISAI ASSISTANCE PROGRAM

The Eisai Assistance Program is your resource for information about benefits for LENVIMA and available financial assistance options. It will help you:

• understand how your therapy may be covered by your insurance
• learn more about out-of-pocket costs for your treatment
• determine eligibility for assistance if you cannot afford your medication

FILLING YOUR LENVIMA PRESCRIPTION THROUGH A SPECIALTY PHARMACY

LENVIMA is an oral medication that is available through a Specialty Pharmacy. LENVIMA is available through 3 Specialty Pharmacies, Accredo, Biologics, and CVS, or through select clinics and hospital pharmacies. Your health care team will tell you which Specialty Pharmacy will supply your medicine. It is important to know the name of your Specialty Pharmacy and to respond promptly to their phone calls and communications.

Check off which Specialty Pharmacy you use and keep this brochure handy as a helpful reminder.

FAX: 1-800-823-4506

WWW.CVSSPECIALTY.COM
PHONE: 1-800-799-0692
FAX: 1-855-296-0210

For more information about LENVIMA financial assistance that may be available, contact your Specialty Pharmacy.

For additional assistance, contact the Eisai Assistance Program at www.LenvimaReimbursement.com or call 1-866-61-EISAI (1-866-613-4724).
Please see Selected Safety Information throughout and on pages 12-15 and accompanying full Prescribing Information.

PATIENT SUPPORT PROGRAM

The Patient Support Program for LENVIMA® provides a number of services to help you throughout your treatment journey. If you receive LENVIMA from Accredo, Biologics, or CVS, you will be automatically enrolled in these services upon consent, whereas if you receive LENVIMA from another source, you may be enrolled via the LENVIMA Eisai Assistance Program Enrollment Form or by calling the Eisai Assistance Program at 1-866-61-EISAI (1-866-613-4724).

The Patient Support Program includes:

- a benefits investigation* to help you understand your coverage for LENVIMA
- a starter kit for you that includes key LENVIMA educational materials and helpful resources
- ongoing communications for monitoring progress, adverse reactions, and questions about LENVIMA therapy

*Reimbursement assistance for patients receiving LENVIMA from a source other than Accredo, Biologics, or CVS will be provided by the Eisai Assistance Program. Please call 1-866-61-EISAI (1-866-613-4724) for more information.

Eisai cannot guarantee payment of any claim. Coding, coverage, and reimbursement may vary significantly by payer, plan, patient, and setting of care. Actual coverage and reimbursement decisions are made by individual payers following the receipt of claims. For additional information, customers should consult with their payers for all relevant coding, reimbursement, and coverage requirements. It is the sole responsibility of the provider to select the proper code and ensure the accuracy of all claims used in seeking reimbursement. All services must be medically appropriate and properly supported in the patient medical record.

CONTACT INFORMATION AND QUESTIONS TO ASK YOUR HEALTH CARE TEAM

Keep track of helpful information below.

MY DOCTOR’S NAME AND PHONE NUMBER:

MY NURSE’S NAME AND PHONE NUMBER:

It is important to ask your health care team any questions you have about LENVIMA. The following are some questions to get you started:

- Why is LENVIMA the right treatment for my thyroid cancer?
- How long do I need to take LENVIMA?
- What side effects should I expect from taking LENVIMA?
- When should I talk to you about side effects I may experience?
- How can I tell the difference between side effects of the treatment with LENVIMA and symptoms of the cancer?
- How can I tell if LENVIMA is working?
- How often should I check in to see if LENVIMA is working?
Learn more at www.LENVIMA.com

You are encouraged to report negative side effects of prescription drugs to the FDA. Visit www.fda.gov/medwatch or call 1-800-FDA-1088.

Please see Selected Safety Information throughout and on pages 12-15 and accompanying full Prescribing Information.
LENVIMA® (lenvatinib) capsules, for oral use
Initial U.S. Approval: 2015

Indications and Usage, Hepatocellular Carcinoma (1.3) 8/2018
Dosage and Administration, Recommended Dose for HCC (2.4) 8/2018
Warnings and Precautions (5.1, 5.14) 8/2018

LENVIMA is a kinase inhibitor that is indicated:
• For the treatment of patients with locally recurrent or metastatic,
  progressive, radioactive iodine-refractory differentiated thyroid cancer
  (DTC). (1.1)
• In combination with everolimus, for the treatment of patients with
  advanced renal cell carcinoma (RCC) following one prior anti-
  angiogenic therapy. (1.2)
• For the first-line treatment of patients with unresectable hepatocellular
  carcinoma (HCC). (1.3)

Dosage and Administration
In combination with everolimus for the treatment of patients with advanced renal cell carcinoma (RCC) following one prior anti-angiogenic therapy, the recommended dose is 18 mg orally once daily with everolimus 5 mg orally once daily. (2.2)

In HCC, the recommended dosage is based on actual body weight:
• 12 mg orally once daily for patients greater than or equal to 60 kg
• Less than 60 kg orally once daily for patients less than 60 kg. (2.4)

ADVERSE REACTIONS
In DTC, the most common adverse reactions (incidence ≥30%) for LENVIMA are hypertension, fatigue, diarrhea, arthralgia/myalgia, decreased appetite, nausea, stomatitis/oral inflammation, hypertension, peripheral edema, cough, abdominal pain, dyspnea, rash, decreased weight, hemorrhagic events, and proteinuria. (6.1)

Diarrhea: May be severe and recurrent. Promptly initiate management for severe diarrhea. Withhold or discontinue based on severity. (2.5, 5.7)

Fistula Formation and Gastrointestinal Perforation: Discontinue in patients who develop Grade 3 or 4 fistula or any Grade gastrointestinal perforation. (2.5, 5.8)

QT Interval Prolongation: Monitor and correct electrolyte abnormalities. Withhold for QT interval greater than 500 ms or for 60 ms or greater increase in baseline QT interval. (2.5, 5.9)

Hypocalcemia: Monitor blood calcium levels at least monthly and replace calcium as necessary. Withhold or discontinue based on severity. (2.5, 5.10)

Reversible Posterior Leukoencephalopathy Syndrome (RPLS): Withhold for RPLS until fully resolved or discontinue. (2.5, 5.11)

Impairment of Thyroid Stimulating Hormone Suppression/Thyroid Dysfunction: Monitor thyroid function prior to treatment and monthly during treatment. (5.13)

Embryo-Fetal Toxicity: Can cause fetal harm. Advise of potential risk to a fetus and use of effective contraception. (5.15, 8.1, 8.3)

CONTRAINDICATIONS
• Proteinuria: Monitor for proteinuria prior to treatment and periodically during treatment. Withhold for 2 or more grams of proteinuria per 24 hours. Discontinue for nephrotic syndrome. (2.5, 5.6)

OTHER ADVERSE REACTIONS

Diabetes Mellitus: Discontinue for Grade 3 or 4 diabetes mellitus. (2.5, 5.14)

Reversible Hypoalbuminemia: Withhold or discontinue following an arterial thromboembolic event. (2.5, 5.2)

Hypertension: Control blood pressure prior to treatment and monitor during treatment. Withhold for Grade 3 hypertension despite optimal antihypertensive therapy. Discontinue for Grade 4 hypertension. (2.5, 5.1)

Cardiac Dysfunction: Monitor for clinical symptoms or signs of cardiac dysfunction. Withhold or discontinue for Grade 3 cardiac dysfunction. Discontinue for Grade 4 cardiac dysfunction. (2.5, 5.2)

Arterial Thromboembolic Events: Discontinue following an arterial thromboembolic event. (2.5, 5.3)

Hepatotoxicity: Monitor liver function prior to treatment and periodically during treatment. Withhold or discontinue for Grade 3 or 4 hepatotoxicity. Discontinue for hepatic failure. (2.5, 5.4)

Renal Failure or Impairment: Withhold or discontinue for Grade 3 or 4 renal failure or impairment. (2.5, 5.5)

Dosage Forms and Strengths
Capsules: 4 mg and 10 mg. (3)

Lactation: Advise not to breastfeed. (8.2)

Use in Specific Populations
Lactation: Advise not to breastfeed. (8.2)

See 17 for Patient Counseling Information and FDA-approved patient labeling.

*Sections or subsections omitted from the full prescribing information are not listed.
FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

1.1 Differentiated Thyroid Cancer
LENVIMA is indicated for the treatment of patients with locally recurrent or metastatic, progressive, radioactive iodine-refractory differentiated thyroid cancer (DTC).

1.2 Renal Cell Carcinoma
LENVIMA is indicated in combination with everolimus for the treatment of patients with advanced renal cell carcinoma (RCC) following one prior anti-angiogenic therapy.

1.3 Hepatocellular Carcinoma
LENVIMA is indicated for the first-line treatment of patients with unresectable hepatocellular carcinoma (HCC).

2 DOSAGE AND ADMINISTRATION

2.1 Important Dosage Information
- Reduce the dose for certain patients with renal or hepatic impairment [see Dosage and Administration (2.6, 2.7)].
- Take LENVIMA once daily, with or without food, at the same time each day [see Clinical Pharmacology (12.3)]. If a dose is missed and cannot be taken within 12 hours, skip that dose and take the next dose at the usual time of administration.

2.2 Recommended Dosage for Differentiated Thyroid Cancer (DTC)
The recommended dosage of LENVIMA is 24 mg orally once daily until disease progression or until unacceptable toxicity.

2.3 Recommended Dosage for Renal Cell Carcinoma (RCC)
The recommended dosage of LENVIMA is 18 mg in combination with 5 mg everolimus orally once daily until disease progression or until unacceptable toxicity.

Refer to everolimus prescribing information for recommended everolimus dosing information.

2.4 Recommended Dosage for Hepatocellular Carcinoma (HCC)
The recommended dosage of LENVIMA is based on actual body weight:
- 12 mg for patients greater than or equal to 60 kg or
- 8 mg for patients less than 60 kg.

Take LENVIMA orally once daily until disease progression or until unacceptable toxicity.
2.5 Dosage Modifications for Adverse Reactions

Recommendations for LENVIMA dose interruption, reduction and discontinuation for adverse reactions are listed in Table 1. Table 2 lists the recommended dosage reductions of LENVIMA for adverse reactions.

<table>
<thead>
<tr>
<th>Adverse Reaction</th>
<th>Severity</th>
<th>Dosage Modifications for LENVIMA</th>
</tr>
</thead>
</table>
| Hypertension [see Warnings and Precautions (5.1)] | Grade 3 | • Withhold for Grade 3 that persists despite optimal antihypertensive therapy.  
• Resume at reduced dose when hypertension is controlled at less than or equal to Grade 2. |
| | Grade 4 | • Permanently discontinue. |
| Cardiac Dysfunction [see Warnings and Precautions (5.2)] | Grade 3 | • Withhold until improves to Grade 0 to 1 or baseline.  
• Resume at a reduced dose or discontinue depending on the severity and persistence of adverse reaction. |
| | Grade 4 | • Permanently discontinue. |
| Arterial Thromboembolic Event [see Warnings and Precautions (5.3)] | Any Grade | • Permanently discontinue. |
| Hepatotoxicity [see Warnings and Precautions (5.4)] | Grade 3 or 4 | • Withhold until improves to Grade 0 to 1 or baseline.  
• Either resume at a reduced dose or discontinue depending on severity and persistence of hepatotoxicity.  
• Permanently discontinue for hepatic failure. |
| Renal Failure or Impairment [see Warnings and Precautions (5.5)] | Grade 3 or 4 | • Withhold until improves to Grade 0 to 1 or baseline.  
• Resume at a reduced dose or discontinue depending on severity and persistence of renal impairment. |
| Proteinuria [see Warnings and Precautions (5.6)] | 2 g or greater proteinuria in 24 hours | • Withhold until less than or equal to 2 grams of proteinuria per 24 hours.  
• Resume at a reduced dose.  
• Permanently discontinue for nephrotic syndrome. |
| Gastrointestinal Perforation [see Warnings and Precautions (5.8)] | Any Grade | • Permanently discontinue. |

When administering LENVIMA in combination with everolimus for the treatment of renal cell carcinoma, reduce the LENVIMA dose first and then the everolimus dose for adverse reactions of both LENVIMA and everolimus. Refer to the everolimus prescribing information for additional dose modification information.

2.6 Dosage Modifications for Severe Renal Impairment

The recommended dosage of LENVIMA for patients with DTC and RCC and severe renal impairment ( creatinine clearance less than 30 mL/min calculated by Cockcroft-Gault equation using actual body weight) is [see Warnings and Precautions (5.5), Use in Specific Populations (8.6)]:

- Differentiated thyroid cancer: 14 mg orally once daily
- Renal cell carcinoma: 10 mg orally once daily

2.7 Dosage Modifications for Severe Hepatic Impairment

The recommended dosage of LENVIMA for patients with DTC or RCC and severe hepatic impairment (Child-Pugh C) is [see Warnings and Precautions (5.4), Use in Specific Populations (8.7)]:

- Differentiated thyroid cancer: 14 mg taken orally once daily
- Renal cell carcinoma: 10 mg taken orally once daily

2.8 Preparation and Administration

LENVIMA capsules can be swallowed whole or dissolved in a small glass of liquid. To dissolve in liquid, put capsules into 1 tablespoon of water or apple juice without breaking or crushing the capsules. Leave the capsules in the water or apple juice for at least 10 minutes. Stir for at least 3 minutes. After drinking the mixture, add 1 tablespoon of water or apple juice to the glass, swirl the contents a few times and swallow the water or apple juice.

3 DOSAGE FORMS AND STRENGTHS

Capsules:
- 4 mg: yellowish-red body and yellowish-red cap, marked in black ink with “Є” on cap and “LENV 4 mg” on body.
- 10 mg: yellow body and yellowish-red cap, marked in black ink with “Є” on cap and “LENV 10 mg” on body.

4 CONTRAINDICATIONS

None.

5 WARNINGS AND PRECAUTIONS

5.1 Hypertension

Hypertension occurred in 73% of patients in SELECT (DTC) receiving LENVIMA 24 mg orally once daily and in 45% of patients in REFLECT (HCC) receiving LENVIMA 8 mg or 12 mg orally once daily. The median time to onset of new or worsening hypertension was 16 days in SELECT and 26 days in REFLECT. Grade 3 hypertension occurred in 44% of
patients in SELECT and in 24% in REFLECT. Grade 4 hypertension occurred <1% in SELECT and Grade 4 hypertension was not reported in REFLECT.

In patients receiving LENVIMA 18 mg orally once daily with everolimus in Study 205 (RCC), hypertension was reported in 42% of patients and the median time to onset of new or worsening hypertension was 35 days. Grade 3 hypertension occurred in 13% of patients. Systolic blood pressure ≥160 mmHg occurred in 29% of patients and diastolic blood pressure ≥100 mmHg occurred in 21% [see Adverse Reactions (6.1)].

Serious complications of poorly controlled hypertension have been reported.

Control blood pressure prior to initiating LENVIMA. Monitor blood pressure after 1 week, then every 2 weeks for the first 2 months, and then at least monthly thereafter during treatment. Withhold and resume at a reduced dose when hypertension is controlled or permanently discontinue LENVIMA based on severity [see Dosage and Administration (2.5)].

5.2 Cardiac Dysfunction

Serious and fatal cardiac dysfunction can occur with LENVIMA. Across clinical trials in 799 patients with DTC, RCC or HCC, Grade 3 or higher cardiac dysfunction (including cardiomyopathy, left or right ventricular dysfunction, congestive heart failure, cardiac failure, ventricular hypokinesia, or decrease in left or right ventricular ejection fraction of more than 20% from baseline) occurred in 3% of LENVIMA-treated patients.

Monitor patients for clinical symptoms or signs of cardiac dysfunction. Withhold and resume at a reduced dose upon recovery or permanently discontinue LENVIMA based on severity [see Dosage and Administration (2.5)].

5.3 Arterial Thromboembolic Events

Among patients receiving LENVIMA or LENVIMA with everolimus, arterial thromboembolic events of any severity occurred in 2% of patients in Study 205 (RCC), 2% of patients in REFLECT (HCC) and 5% of patients in SELECT (DTC). Grade 3 to 5 arterial thromboembolic events ranged from 2% to 3% across all clinical trials [see Adverse Reactions (6.1)].

Permanently discontinue LENVIMA following an arterial thrombotic event [see Dosage and Administration (2.5)]. The safety of resuming LENVIMA after an arterial thromboembolic event has not been established and LENVIMA has not been studied in patients who have had an arterial thromboembolic event within the previous 6 months.

5.4 Hepatotoxicity

Across clinical studies enrolling 1327 LENVIMA-treated patients with malignancies other than HCC, serious hepatic adverse reactions occurred in 1.4% of patients. Fatal events, including hepatic failure, acute hepatitis and hepatorenal syndrome, occurred in 0.5% of patients.

In REFLECT (HCC), hepatic encephalopathy (including hepatic encephalopathy, encephalopathy, metabolic encephalopathy, and hepatic coma) occurred in 8% of LENVIMA-treated patients and 3% of sorafenib-treated patients. Grade 3 to 5 hepatic encephalopathy occurred in 5% of LENVIMA-treated patients and 2% of sorafenib-treated patients. Grade 3 to 5 hepatic failure occurred in 3% of LENVIMA-treated patients and 3% of sorafenib-treated patients. Two percent of patients discontinued LENVIMA and 0.2%
discontinued sorafenib due to hepatic encephalopathy and 1% of patients discontinued lenvatinib or sorafenib due to hepatic failure [see Adverse Reactions (6.1)].

Monitor liver function prior to initiating LENVIMA, then every 2 weeks for the first 2 months, and at least monthly thereafter during treatment. Monitor patients with HCC closely for signs of hepatic failure, including hepatic encephalopathy. Withhold and resume at a reduced dose upon recovery or permanently discontinue LENVIMA based on severity [see Dosage and Administration (2.5)].

5.5 Renal Failure or Impairment

Serious including fatal renal failure or impairment can occur with LENVIMA. Renal impairment occurred in 14% of patients receiving LENVIMA in SELECT (DTC) and in 7% of patients receiving LENVIMA in REFLECT (HCC). Grade 3 to 5 renal failure or impairment occurred in 3% (DTC) and 2% (HCC) of patients, including 1 fatality in each study.

In Study 205 (RCC), renal impairment or renal failure occurred in 18% of patients receiving LENVIMA with everolimus, including Grade 3 in 10% of patients [see Adverse Reactions (6.1)].

Initiate prompt management of diarrhea or dehydration/hypovolemia. Withhold and resume at a reduced dose upon recovery or permanently discontinue LENVIMA for renal failure or impairment based on severity [see Dosage and Administration (2.5)].

5.6 Proteinuria

Proteinuria occurred in 34% of LENVIMA-treated patients in SELECT (DTC) and in 26% of LENVIMA-treated patients in REFLECT (HCC). Grade 3 proteinuria occurred in 11% and 6% in SELECT and REFLECT, respectively. In Study 205 (RCC), proteinuria occurred in 31% of patients receiving LENVIMA with everolimus and 14% of patients receiving everolimus. Grade 3 proteinuria occurred in 8% of patients receiving LENVIMA with everolimus compared to 2% of patients receiving everolimus [see Adverse Reactions (6.1)].

Monitor for proteinuria prior to initiating LENVIMA and periodically during treatment. If urine dipstick proteinuria greater than or equal to 2+ is detected, obtain a 24-hour urine protein. Withhold and resume at a reduced dose upon recovery or permanently discontinue LENVIMA based on severity [seeDosage and Administration (2.5)].

5.7 Diarrhea

Of the 737 patients treated with LENVIMA in SELECT (DTC) and REFLECT (HCC), diarrhea occurred in 49% of patients, including Grade 3 in 6%.

In Study 205 (RCC), diarrhea occurred in 81% of patients receiving LENVIMA with everolimus, including Grade 3 in 19%. Diarrhea was the most frequent cause of dose interruption/reduction and diarrhea recurred despite dose reduction [see Adverse Reactions (6.1)].

Promptly initiate management of diarrhea. Withhold and resume at a reduced dose upon recovery or permanently discontinue LENVIMA based on severity [see Dosage and Administration (2.5)].

5.8 Fistula Formation and Gastrointestinal Perforation
Of 799 patients treated with LENVIMA or LENVIMA with everolimus in SELECT (DTC), Study 205 (RCC) and REFLECT (HCC), fistula or gastrointestinal perforation occurred in 2%.

Permanently discontinue LENVIMA in patients who develop gastrointestinal perforation of any severity or Grade 3 or 4 fistula [see Dosage and Administration (2.5)].

5.9 QT Interval Prolongation

In SELECT (DTC), QT/QTc interval prolongation occurred in 9% of LENVIMA-treated patients and QT interval prolongation of >500 ms occurred in 2%. In Study 205 (RCC), QTc interval increases of >60 ms occurred in 11% of patients receiving LENVIMA with everolimus and QTc interval >500 ms occurred in 6%. In REFLECT (HCC), QTc interval increases of >60 ms occurred in 8% of LENVIMA-treated patients and QTc interval >500 ms occurred in 2%.

Monitor and correct electrolyte abnormalities at baseline and periodically during treatment. Monitor electrocardiograms in patients with congenital long QT syndrome, congestive heart failure, bradyarrhythmias, or those who are taking drugs known to prolong the QT interval, including Class Ia and III antiarrhythmics. Withhold and resume at reduced dose of LENVIMA upon recovery based on severity [see Dosage and Administration (2.5)].

5.10 Hypocalcemia

In SELECT (DTC), Grade 3 to 4 hypocalcemia occurred in 9% of patients receiving LENVIMA. In 65% of cases, hypocalcemia improved or resolved following calcium supplementation, with or without dose interruption or dose reduction.

In Study 205 (RCC), Grade 3 to 4 hypocalcemia occurred in 6% of patients treated with LENVIMA with everolimus. In REFLECT (HCC), Grade 3 hypocalcemia occurred in 0.8% of LENVIMA-treated patients [see Adverse Reactions (6.1)].

Monitor blood calcium levels at least monthly and replace calcium as necessary during treatment. Withhold and resume at reduced dose upon recovery or permanently discontinue LENVIMA depending on severity [see Dosage and Administration (2.5)].

5.11 Reversible Posterior Leukoencephalopathy Syndrome

Across clinical studies of 1823 patients who received LENVIMA as a single agent [see Adverse Reaction (6.1)], reversible posterior leukoencephalopathy syndrome (RPLS) occurred in 0.3%.

Confirm the diagnosis of RPLS with magnetic resonance imaging. Withhold and resume at a reduced dose upon recovery or permanently discontinue LENVIMA depending on severity and persistence of neurologic symptoms [see Dosage and Administration (2.5)].

5.12 Hemorrhagic Events

Serious including fatal hemorrhagic events can occur with LENVIMA. Across SELECT (DTC), Study 205 (RCC) and REFLECT (HCC), hemorrhagic events of any grade occurred in 29% of the 799 patients treated with LENVIMA as a single agent or in combination with everolimus. The most frequently reported hemorrhagic events (all grades and occurring in at least 5% of patients) were epistaxis and hematuria.

In SELECT, Grade 3 to 5 hemorrhage occurred in 2% of patients receiving LENVIMA, including 1 fatal intracranial hemorrhage among 16 patients who received LENVIMA and had CNS metastases at baseline. In Study 205, Grade 3 to 5 hemorrhage occurred in 8% of
patients receiving LENVIMA with everolimus, including 1 fatal cerebral hemorrhage. In REFLECT, Grade 3 to 5 hemorrhage occurred in 5% of patients receiving LENVIMA, including 7 fatal hemorrhagic events [see Adverse Reactions (6.1)].

Serious tumor related bleeds, including fatal hemorrhagic events, occurred in patients treated with LENVIMA in clinical trials and in the post-marketing setting. In post-marketing surveillance, serious and fatal carotid artery hemorrhages were seen more frequently in patients with anaplastic thyroid carcinoma (ATC) than in other tumor types. The safety and effectiveness of LENVIMA in patients with ATC have not been demonstrated in clinical trials.

Consider the risk of severe or fatal hemorrhage associated with tumor invasion or infiltration of major blood vessels (e.g. carotid artery). Withhold and resume at reduced dose upon recovery or permanently discontinue LENVIMA based on the severity [see Dosage and Administration (2.5)].

5.13 Impairment of Thyroid Stimulating Hormone Suppression/Thyroid Dysfunction

LENVIMA impairs exogenous thyroid suppression. In SELECT (DTC), 88% of all patients had a baseline thyroid stimulating hormone (TSH) level ≤0.5 mU/L. In those patients with a normal TSH at baseline, elevation of TSH level >0.5 mU/L was observed post baseline in 57% of LENVIMA-treated patients.

Grade 1 or 2 hypothyroidism occurred in 24% of patients receiving LENVIMA with everolimus in Study 205 (RCC) and in 21% of patients receiving LENVIMA in REFLECT (HCC). In those patients with a normal or low TSH at baseline, an elevation of TSH was observed post baseline in 70% of patients receiving LENVIMA in REFLECT and 60% of patients receiving LENVIMA with everolimus in Study 205 [see Adverse Reactions (6.1)].

Monitor thyroid function prior to initiating LENVIMA and at least monthly during treatment. Treat hypothyroidism according to standard medical practice.

5.14 Wound Healing Complications

Wound healing complications, including fistula formation and wound dehiscence, can occur with LENVIMA. Withhold LENVIMA for at least 6 days prior to scheduled surgery. Resume LENVIMA after surgery based on clinical judgment of adequate wound healing. Permanently discontinue LENVIMA in patients with wound healing complications.

5.15 Embryo-Fetal Toxicity

Based on its mechanism of action and data from animal reproduction studies, LENVIMA can cause fetal harm when administered to a pregnant woman. In animal reproduction studies, oral administration of lenvatinib during organogenesis at doses below the recommended clinical doses resulted in embryotoxicity, fetotoxicity, and teratogenicity in rats and rabbits.

Advise pregnant women of the potential risk to a fetus. Advise females of reproductive potential to use effective contraception during treatment with LENVIMA and for at least 30 days after the last dose [see Use in Specific Populations (8.1, 8.3)].

6 ADVERSE REACTIONS

The following adverse reactions are discussed elsewhere in the labeling:
• Hypertension [see Warnings and Precautions (5.1)]
• Cardiac Dysfunction [see Warnings and Precautions (5.2)]
• Arterial Thromboembolic Events [see Warnings and Precautions (5.3)]
• Hepatotoxicity [see Warnings and Precautions (5.4)]
• Renal Failure and Impairment [see Warnings and Precautions (5.5)]
• Proteinuria [see Warnings and Precautions (5.6)]
• Diarrhea [see Warnings and Precautions (5.7)]
• Fistula Formation and Gastrointestinal Perforation [see Warnings and Precautions (5.8)]
• QT Interval Prolongation [see Warnings and Precautions (5.9)]
• Hypocalcemia [see Warnings and Precautions (5.10)]
• Reversible Posterior Leukoencephalopathy Syndrome [see Warnings and Precautions (5.11)]
• Hemorrhagic Events [see Warnings and Precautions (5.12)]
• Impairment of Thyroid Stimulating Hormone Suppression/Thyroid Dysfunction [see Warnings and Precautions (5.13)]
• Wound Healing Complications [see Warnings and Precautions (5.14)]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The data in the Warnings and Precautions reflect exposure to LENVIMA as a single agent in 261 patients with DTC (SELECT) and 476 patients with HCC (REFLECT), and to LENVIMA with everolimus in 62 patients with RCC (Study 205). Safety data obtained in 1823 patients with advanced solid tumors who received LENVIMA as a single agent across multiple clinical studies was used to further characterize the risks of serious adverse reactions. Among the 1823 patients who received LENVIMA as a single agent, the median age was 61 years (20 to 89 years), the dose range was 0.2 mg to 32 mg daily, and the median duration of exposure was 5.6 months.

The data below reflect exposure to LENVIMA in 799 patients enrolled in randomized, active-controlled trials (REFLECT; Study 205) or a randomized, placebo-controlled trial (SELECT). The median duration of exposure to LENVIMA across these three studies ranged from 6 to 16 months. The demographic and exposure data for each clinical trial population are described in the subsections below.

Differentiated Thyroid Cancer

The safety of LENVIMA was evaluated in SELECT, in which patients with radioactive iodine-refractory differentiated thyroid cancer were randomized (2:1) to LENVIMA (n=261) or placebo (n=131) [see Clinical Studies (14.1)]. The median treatment duration was 16.1 months for LENVIMA. Among 261 patients who received LENVIMA, median age was 64
years, 52% were females, 80% were White, 18% were Asian, and 2% were Black; and 4% were Hispanic/Latino.

The most common adverse reactions observed in LENVIMA-treated patients (≥30%) were, in order of decreasing frequency, hypertension, fatigue, diarrhea, arthralgia/myalgia, decreased appetite, decreased weight, nausea, stomatitis, headache, vomiting, proteinuria, palmar-plantar erythrodysesthesia (PPE) syndrome, abdominal pain, and dysphonia. The most common serious adverse reactions (at least 2%) were pneumonia (4%), hypertension (3%), and dehydration (3%).

Adverse reactions led to dose reductions in 68% of patients receiving LENVIMA; 18% of patients discontinued LENVIMA for adverse reactions. The most common adverse reactions (at least 10%) resulting in dose reductions of LENVIMA were hypertension (13%), proteinuria (11%), decreased appetite (10%), and diarrhea (10%); the most common adverse reactions (at least 1%) resulting in discontinuation of LENVIMA were hypertension (1%) and asthenia (1%).

Table 3 presents adverse reactions occurring at a higher rate in LENVIMA-treated patients than patients receiving placebo in the double-blind phase of the study.

\textsuperscript{a} With at least 1 grade increase from baseline

\textsuperscript{b} Laboratory Abnormality percentage is based on the number of patients who had both baseline and at least one post baseline laboratory measurement for each parameter. LENVIMA (n = 253 to 258), Placebo (n = 129 to 131)

The following laboratory abnormalities (all Grades) occurred in >5% of LENVIMA-treated patients and at a rate that was two-fold or higher than in patients who received placebo: hypoalbuminemia, increased alkaline phosphatase, hypomagnesemia, hypoglycemia, hyperbilirubinemia, hypercalcemia, hypercholesterolemia, increased serum amylase, and hyperkalemia.

Renal Cell Carcinoma

The safety of LENVIMA was evaluated in Study 205, in which patients with unresectable advanced or metastatic renal cell carcinoma (RCC) were randomized (1:1:1) to LENVIMA 18 mg orally once daily with everolimus 5 mg orally once daily (n=51), LENVIMA 24 mg orally once daily (n=52), or everolimus 10 mg orally once daily (n=50) [see Clinical Studies (14.2)]. This data also includes patients on the dose escalation portion of the study who received LENVIMA with everolimus (n=11). The median treatment duration was 8.1 months for LENVIMA with everolimus. Among 62 patients who received LENVIMA with everolimus, the median age was 61 years, 71% were men, and 98% were White.

The most common adverse reactions observed in the LENVIMA with everolimus-treated group (≥30%) were, in order of decreasing frequency, diarrhea, fatigue, arthralgia/myalgia, decreased appetite, vomiting, nausea, stomatitis/oral inflammation, hypertension, peripheral edema, cough, abdominal pain, dyspnea, rash, decreased weight, hemorrhagic events, and proteinuria. The most common serious adverse reactions (≥5%) were renal failure (11%), dehydration (10%), anemia (6%), thrombocytopenia (5%), diarrhea (5%), vomiting (5%), and dyspnea (5%).

Adverse reactions led to dose reductions or interruption in 89% of patients receiving LENVIMA with everolimus. The most common adverse reactions (≥5%) resulting in dose reductions in the LENVIMA with everolimus-treated group were diarrhea (21%), fatigue (8%), thrombocytopenia (6%), vomiting (6%), nausea (5%), and proteinuria (5%).
Treatment discontinuation due to an adverse reaction occurred in 29% of patients in the LENVIMA with everolimus-treated group.

Table 5 presents the adverse reactions in >15% of patients in the LENVIMA with everolimus arm. Study 205 was not designed to demonstrate a statistically significant difference in adverse reaction rates for LENVIMA in combination with everolimus, as compared to everolimus for any specific adverse reaction listed in Table 5.

| Table 5: Adverse Reactions Occurring in >15% of Patients in the LENVIMA with Everolimus Arm in Study 205 (RCC) |
|-------------------------------------------------|---------------------------------|---------------------------------|---------------------------------|
| Adverse Reactions                               | LENVIMA 18 mg with Everolimus 5 mg | Everolimus 10 mg |
|                                                 | N=62                              | N=50                             |

\textsuperscript{a} With at least 1 grade increase from baseline  
\textsuperscript{b} Laboratory Abnormality percentage is based on the number of patients who had both baseline and at least one post baseline laboratory measurement for each parameter. LENVIMA with Everolimus (n = 62), Everolimus (n = 50).

Hepatocellular Carcinoma

The safety of LENVIMA was evaluated in REFLECT, which randomized (1:1) patients with unresectable hepatocellular carcinoma (HCC) to LENVIMA (n=476) or sorafenib (n=475) [see Clinical Studies (14.3)]. The dose of LENVIMA was 12 mg orally once daily for patients with a baseline body weight of ≥60 kg and 8 mg orally once daily for patients with a baseline body weight of <60 kg. The dose of sorafenib was 400 mg orally twice daily. Duration of treatment was ≥6 months in 49% and 32% of patients in the LENVIMA and sorafenib groups, respectively. Among the 476 patients who received LENVIMA in REFLECT, the median age was 63 years, 85% were men, 28% were White and 70% were Asian.

The most common adverse reactions observed in the LENVIMA-treated patients (≥20%) were, in order of decreasing frequency, hypertension, fatigue, diarrhea, decreased appetite, arthralgia/myalgia, decreased weight, abdominal pain, palmar-plantar erythrodysesthesia syndrome, proteinuria, dysphonia, hemorrhagic events, hypothyroidism, and nausea.

The most common serious adverse reactions (≥2%) in LENVIMA-treated patients were hepatic encephalopathy (5%), hepatic failure (3%), ascites (3%), and decreased appetite (2%).

Adverse reactions led to dose reduction or interruption in 62% of patients receiving LENVIMA. The most common adverse reactions (≥5%) resulting in dose reduction or interruption of LENVIMA were fatigue (9%), decreased appetite (8%), diarrhea (8%), proteinuria (7%), hypertension (6%), and palmar-plantar erythrodysesthesia syndrome (5%).

Treatment discontinuation due to adverse reactions occurred in 20% of patients in the LENVIMA-treated group. The most common adverse reactions (≥1%) resulting in discontinuation of LENVIMA were fatigue (1%), hepatic encephalopathy (2%), hyperbilirubinemia (1%), and hepatic failure (1%).

Table 7 summarizes the adverse reactions that occurred in ≥10% of patients receiving LENVIMA in REFLECT. REFLECT was not designed to demonstrate a statistically significant reduction in adverse reaction rates for LENVIMA, as compared to sorafenib, for any specified adverse reaction listed in Table 7.

\textsuperscript{a} With at least 1 grade increase from baseline

\textsuperscript{b} Laboratory Abnormality percentage is based on the number of patients who had both baseline and at least one post baseline laboratory measurement for each parameter. LENVIMA (n=278 to 470) and sorafenib (n=260 to 473)

6.2 Postmarketing Experience

The following adverse reactions have been identified during post approval use of LENVIMA. Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.
Gastrointestinal: pancreatitis, increased amylase
General: impaired wound healing
Hepatobiliary: cholecystitis
Renal and Urinary: nephrotic syndrome
Vascular: aortic dissection

7 DRUG INTERACTIONS
7.1 Drugs That Prolong the QT Interval
LENVIMA has been reported to prolong the QT/QTc interval. Avoid coadministration of LENVIMA with medicinal products with a known potential to prolong the QT/QTc interval [see Warnings and Precautions (5.9)].

8 USE IN SPECIFIC POPULATIONS
8.1 Pregnancy
Risk Summary
Based on its mechanism of action and data from animal reproduction studies, LENVIMA can cause fetal harm when administered to a pregnant woman [see Clinical Pharmacology (12.1)]. In animal reproduction studies, oral administration of lenvatinib during organogenesis at doses below the recommended human doses resulted in embryotoxicity, fetotoxicity, and teratogenicity in rats and rabbits [see Data]. There are no available human data informing the drug-associated risk. Advise pregnant women of the potential risk to a fetus.

In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2% to 4% and 15% to 20%, respectively.

Data
Animal Data
In an embryofetal development study, daily oral administration of lenvatinib mesylate at doses ≥0.3 mg/kg [approximately 0.14 times the recommended clinical dose of 24 mg based on body surface area (BSA)] to pregnant rats during organogenesis resulted in dose-related decreases in mean fetal body weight, delayed fetal ossifications, and dose-related increases in fetal external (parietal edema and tail abnormalities), visceral, and skeletal anomalies. Greater than 80% postimplantation loss was observed at 1.0 mg/kg/day (approximately 0.5 times the recommended clinical dose of 24 mg based on BSA).

Daily oral administration of lenvatinib mesylate to pregnant rabbits during organogenesis resulted in fetal external (short tail), visceral (retrooesophageal subclavian artery), and skeletal anomalies at doses greater than or equal to 0.03 mg/kg (approximately 0.03 times the recommended clinical dose of 24 mg based on BSA). At the 0.03 mg/kg dose, increased postimplantation loss, including 1 fetal death, was also observed. Lenvatinib was abortifacient in rabbits, resulting in late abortions in approximately one-third of the rabbits treated at a dose level of 0.5 mg/kg/day (approximately 0.5 times the recommended clinical dose of 24 mg based on BSA).

8.2 Lactation
Risk Summary

It is not known whether LENVIMA is present in human milk; however, lenvatinib and its metabolites are excreted in rat milk at concentrations higher than those in maternal plasma (see Data). Because of the potential for serious adverse reactions in breastfed infants, advise women to discontinue breastfeeding during treatment with LENVIMA and for at least 1 week after the last dose.

Data

Animal Data

Following administration of radiolabeled lenvatinib to lactating Sprague Dawley rats, lenvatinib-related radioactivity was approximately 2 times higher [based on area under the curve (AUC)] in milk compared to maternal plasma.

8.3 Females and Males of Reproductive Potential

Pregnancy Testing

Verify the pregnancy status of females of reproductive potential prior to initiating LENVIMA [see Use in Specific Populations (8.1)].

Contraception

Based on its mechanism of action, LENVIMA can cause fetal harm when administered to a pregnant woman [see Use in Specific Populations (8.1)].

Females

Advise females of reproductive potential to use effective contraception during treatment with LENVIMA and for at least 30 days after the last dose.

Infertility

LENVIMA may impair fertility in males and females of reproductive potential [see Nonclinical Toxicology (13.1)].

8.4 Pediatric Use

The safety and effectiveness of LENVIMA in pediatric patients have not been established.

Juvenile Animal Data

Daily oral administration of lenvatinib mesylate to juvenile rats for 8 weeks starting on postnatal day 21 (approximately equal to a human pediatric age of 2 years) resulted in growth retardation (decreased body weight gain, decreased food consumption, and decreases in the width and/or length of the femur and tibia) and secondary delays in physical development and reproductive organ immaturity at doses greater than or equal to 2 mg/kg (approximately 1.2 to 5 times the human exposure based on AUC at the recommended clinical dose of 24 mg). Decreased length of the femur and tibia persisted following 4 weeks of recovery. In general, the toxicologic profile of lenvatinib was similar between juvenile and adult rats, though toxicities including broken teeth at all dose levels and mortality at the 10 mg/kg/day dose level (attributed to primary duodenal lesions) occurred at earlier treatment time-points in juvenile rats.
8.5 Geriatric Use

Of the 261 patients with differentiated thyroid cancer (DTC) who received LENVIMA in SELECT, 45% were ≥65 years of age and 11% were ≥75 years of age. No overall differences in safety or effectiveness were observed between these subjects and younger subjects.

Of the 62 patients with renal cell carcinoma (RCC) who received LENVIMA with everolimus in Study 205, 36% were ≥65 years of age. Conclusions are limited due to the small sample size, but there appeared to be no overall differences in safety or effectiveness between these subjects and younger subjects.

Of the 476 patients with hepatocellular carcinoma (HCC) who received LENVIMA in REFLECT, 44% were ≥65 years of age and 12% were ≥75 years of age. No overall differences in safety or effectiveness were observed between patients ≥65 and younger subjects. Patients ≥75 years of age showed reduced tolerability to LENVIMA.

8.6 Renal Impairment

No dose adjustment is recommended for patients with mild (CLcr 60-89 mL/min) or moderate (CLcr 30-59 mL/min) renal impairment. Lenvatinib concentrations may increase in patients with DTC or RCC and severe (CLcr 15-29 mL/min) renal impairment. Reduce the dose for patients with RCC or DTC and severe renal impairment [see Dosage and Administration (2.5)]. There is no recommended dose of LENVIMA for patients with HCC and severe renal impairment. LENVIMA has not been studied in patients with end stage renal disease [see Warnings and Precautions (5.5), Clinical Pharmacology (12.3)].

8.7 Hepatic Impairment

No dose adjustment is recommended for patients with HCC and mild hepatic impairment (Child-Pugh A). There is no recommended dose for patients with HCC with moderate or severe hepatic impairment.

No dose adjustment is recommended for patients with DTC or RCC and mild or moderate hepatic impairment (Child-Pugh A or B). Lenvatinib concentrations may increase in patients with DTC or RCC and severe hepatic impairment (Child-Pugh C). Reduce the dose for patients with DTC or RCC and severe hepatic impairment [see Dosage and Administration (2.5), Clinical Pharmacology (12.3)].

10 OVERDOSAGE

Due to the high plasma protein binding, lenvatinib is not expected to be dialyzable [see Clinical Pharmacology (12.3)]. Death due to multiorgan dysfunction occurred in a patient who received a single dose of LENVIMA 120 mg orally.

11 DESCRIPTION

LENVIMA, a kinase inhibitor, is the mesylate salt of lenvatinib. Its chemical name is 4-[3-chloro-4-(N’-cyclopropylureido)phenoxy]-7-methoxyquinoline-6-carboxamide methanesulfonate. The molecular formula is C_{21}H_{19}ClN_{4}O_{4} • CH_{4}O_{3}S, and the molecular weight of the mesylate salt is 522.96. The chemical structure of lenvatinib mesylate is:
Lenvatinib mesylate is a white to pale reddish yellow powder. It is slightly soluble in water and practically insoluble in ethanol (dehydrated). The dissociation constant (pKa value) of lenvatinib mesylate is 5.05 at 25°C. The partition coefficient (log P value) is 3.3.

LENVIMA capsules for oral administration contain 4 mg or 10 mg of lenvatinib, equivalent to 4.90 mg or 12.25 mg of lenvatinib mesylate, respectively. Following are inactive ingredients: Calcium Carbonate, USP; Mannitol, USP; Microcrystalline Cellulose, NF; Hydroxypropyl Cellulose, NF; Low-substituted Hydroxypropyl Cellulose, NF; and Talc, USP. The hypromellose capsule shell contains titanium dioxide, ferric oxide yellow, and ferric oxide red. The printing ink contains shellac, black iron oxide, potassium hydroxide, and propylene glycol.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Lenvatinib is a kinase inhibitor that inhibits the kinase activities of vascular endothelial growth factor (VEGF) receptors VEGFR1 (FLT1), VEGFR2 (KDR), and VEGFR3 (FLT4). Lenvatinib inhibits other kinases that have been implicated in pathogenic angiogenesis, tumor growth, and cancer progression in addition to their normal cellular functions, including fibroblast growth factor (FGF) receptors FGFR1, 2, 3, and 4; platelet derived growth factor receptor alpha (PDGFRα), KIT, and RET. Lenvatinib also exhibited antiproliferative activity in hepatocellular carcinoma cell lines dependent on activated FGFR signaling with a concurrent inhibition of FGF-receptor substrate 2α (FRS2α) phosphorylation. The combination of lenvatinib and everolimus showed increased antiangiogenic and antitumor activity as demonstrated by decreases in human endothelial cell proliferation, tube formation, and VEGF signaling in vitro, and by decreases in tumor volume in mouse xenograft models of human renal cell cancer that were greater than those with either drug alone.

12.3 Pharmacokinetics

In patients with solid tumors administered single and multiple doses of LENVIMA once daily, the maximum lenvatinib plasma concentration ($C_{\text{max}}$) and the area under the concentration-time curve (AUC) increased proportionally over the dose range of 3.2 mg (0.1 times the recommended clinical dose of 24 mg) to 32 mg (1.33 times the recommended clinical dose of 24 mg) with a median accumulation index of 0.96 (20 mg) to 1.54 (6.4 mg).

Absorption

The time to peak plasma concentration ($T_{\text{max}}$) typically occurred from 1 to 4 hours post-dose.

Food Effect

Administration with a high fat meal (approximately 900 calories of which approximately 55% were from fat, 15% from protein, and 30% from carbohydrates) did not affect the extent
of absorption, but decreased the rate of absorption and delayed the median $T_{\text{max}}$ from 2 hours to 4 hours.

**Distribution**

In vitro binding of lenvatinib to human plasma proteins ranged from 98% to 99% at concentrations of 0.3 to 30 $\mu$g/mL. The blood-to-plasma concentration ratio ranged from 0.59 to 0.61 at concentrations of 0.1 to 10 $\mu$g/mL in vitro.

**Elimination**

The terminal elimination half-life of lenvatinib was approximately 28 hours.

**Metabolism**

The main metabolic pathways for lenvatinib in humans were identified as enzymatic (CYP3A and aldehyde oxidase) and non-enzymatic processes.

**Excretion**

Ten days after a single administration of radiolabeled lenvatinib, approximately 64% and 25% of the radiolabel were eliminated in the feces and urine, respectively.

**Specific Populations:**

Age, sex, and race did not have a significant effect on apparent oral clearance (CL/F).

**Patients with Renal Impairment**

The pharmacokinetics of lenvatinib following a single 24 mg dose were evaluated in subjects with mild (CLcr 60-89 mL/min), moderate (CLcr 30-59 mL/min), or severe (CLcr <30 mL/min) renal impairment, and compared to healthy subjects. Subjects with end stage renal disease were not studied. The $\text{AUC}_{0-\text{inf}}$ for subjects with renal impairment were similar compared to those for healthy subjects.

**Patients with Hepatic Impairment**

The pharmacokinetics of lenvatinib following a single 10 mg dose were evaluated in subjects with mild (Child-Pugh A) or moderate (Child-Pugh B) hepatic impairment. The pharmacokinetics of a single 5 mg dose were evaluated in subjects with severe (Child-Pugh C) hepatic impairment. Compared to subjects with normal hepatic function, the dose-adjusted $\text{AUC}_{0-\text{inf}}$ of lenvatinib for subjects with mild, moderate, and severe hepatic impairment were 119%, 107%, and 180%, respectively. Apparent oral clearance of lenvatinib in patients with HCC and mild hepatic impairment was similar to patients with HCC and moderate hepatic impairment.

**Tumor**

Patients with HCC in REFLECT had a 13% lower lenvatinib CL/F than patients with other cancer types.

**Body Weight**

Lenvatinib exposures in patients with HCC in REFLECT were comparable between those weighing <60 kg who received a starting dose of 8 mg and those $\geq$60 kg who received a starting dose of 12 mg.
Drug Interaction Studies

Effect of Other Drugs on Lenvatinib

**CYP3A, P-gp, and BCRP Inhibitors:** Ketoconazole (400 mg daily for 18 days) increased lenvatinib (administered as a single 5 mg dose on Day 5) AUC by 15% and C\text{max} by 19%.

**P-gp Inhibitor:** Rifampicin (600 mg as a single dose) increased lenvatinib (24 mg as a single dose) AUC by 31% and C\text{max} by 33%.

**CYP3A and P-gp Inducers:** Rifampicin (600 mg daily for 21 days) decreased lenvatinib (24 mg as a single dose on Day 15) AUC by 18%. The C\text{max} was unchanged.

**In Vitro Studies with Transporters:** Lenvatinib is a substrate of P-gp and BCRP but not a substrate for organic anion transporter (OAT) 1, OAT3, organic anion transporting polypeptide (OATP) 1B1, OATP1B3, organic cation transporter (OCT) 1, OCT2, multidrug and toxin extrusion (MATE) 1, MATE2-K, or the bile salt export pump (BSEP).

Effect of Lenvatinib on Other Drugs

**Clinical Studies with Substrates of CYP3A4 or CYP2C8:** There is no projected significant drug-drug interaction risk between lenvatinib and midazolam (a CYP3A4 substrate) or repaglinide (a CYP2C8 substrate).

**In Vitro Studies with Substrates of CYP or UDP-glucuronosyltransferase (UGT):** Lenvatinib inhibits CYP2C8, CYP1A2, CYP2B6, CYP2C9, CYP2C19, CYP2D6, and CYP3A. Lenvatinib does not inhibit CYP2A6 and CYP2E1. Lenvatinib induces CYP3A, but it does not induce CYP1A1, CYP1A2, CYP2B6, and CYP2C9.

Lenvatinib inhibits UGT1A1, UGT1A4, and UGT1A9 in vitro, but likely only inhibits UGT1A1 in vivo in the gastrointestinal tract based on the expression of the enzyme in tissues. Lenvatinib does not inhibit UGT1A6, UGT2B7 or aldehyde oxidase. Lenvatinib does not induce UGT1A1, UGT1A4, UGT1A6, UGT1A9, or UGT2B7.

**In Vitro Studies with Substrates of Transporters:**

Lenvatinib does not have the potential to inhibit MATE1, MATE2-K, OCT1, OCT2, OAT1, OAT3, BSEP, OATP1B1, or OATP1B3 in vivo.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenicity studies have not been conducted with lenvatinib. Lenvatinib mesylate was not mutagenic in the in vitro bacterial reverse mutation (Ames) assay. Lenvatinib was not clastogenic in the in vitro mouse lymphoma thymidine kinase assay or the in vivo rat micronucleus assay.

No specific studies with lenvatinib have been conducted in animals to evaluate the effect on fertility; however, results from general toxicology studies in rats, monkeys, and dogs suggest there is a potential for lenvatinib to impair fertility. Male dogs exhibited testicular hypocellularity of the seminiferous epithelium and desquamated seminiferous epithelial cells in the epididymides at lenvatinib exposures approximately 0.02 to 0.09 times the AUC at the recommended clinical dose of 24 mg once daily. Follicular atresia of the ovaries was observed in monkeys and rats at exposures 0.2 to 0.8 times and 10 to 44 times the AUC at the recommended clinical dose of 24 mg once daily, respectively. In addition, in monkeys, a
decreased incidence of menstruation was reported at lenvatinib exposures lower than those observed in humans at the recommended clinical dose of 24 mg once daily.

14 CLINICAL STUDIES

14.1 Differentiated Thyroid Cancer

A multicenter, randomized (2:1), double-blind, placebo-controlled study (SELECT; NCT01321554) was conducted in 392 patients with locally recurrent or metastatic radioactive iodine-refractory differentiated thyroid cancer and radiographic evidence of disease progression within 12 months prior to randomization, confirmed by independent radiologic review. Radioactive iodine (RAI)-refractory was defined as 1 or more measurable lesions with no iodine uptake on RAI scan, iodine uptake with progression within 12 months of RAI therapy, or having received cumulative RAI activity >600 mCi (22 GBq) with the last dose administered at least 6 months prior to study entry. Patients were randomized to receive LENVIMA 24 mg once daily (n=261) or placebo (n=131) until disease progression. Randomization was stratified by geographic region, prior VEGF/VEGFR-targeted therapy, and age. The major efficacy outcome measure was progression-free survival (PFS) as determined by blinded independent radiologic review using Response Evaluation Criteria in Solid Tumors (RECIST) 1.1. Independent review confirmation of disease progression was required prior to discontinuing patients from the randomization phase of the study. Other efficacy outcome measures included objective response rate (ORR) and overall survival (OS). Patients in the placebo arm could receive lenvatinib following independent review confirmation of disease progression.

Of the 392 patients randomized, 51% were male, the median age was 63 years, 40% were 65 years or older, 79% were White, 54% had an Eastern Cooperative Oncology Group (ECOG) performance status (PS) of 0, and 24% had received 1 prior VEGF/VEGFR-targeted therapy. Metastases were present in 99% of the patients: lungs in 89%, lymph nodes in 52%, bone in 39%, liver in 18%, and brain in 4%. The histological diagnoses were papillary thyroid cancer (66%) and follicular thyroid cancer (34%); of those with follicular histology, 44% had Hürthle cell and 11% had clear cell subtypes. In the LENVIMA arm, 67% of patients did not demonstrate iodine uptake on any RAI scan compared to 77% in the placebo arm. Additionally, 59% of patients on the LENVIMA arm and 61% of patients on placebo arm progressed, according to RECIST 1.1, within 12 months of prior I 131 therapy; 19.2% of patients on the LENVIMA arm and 17.6% of patients on placebo arm received prior cumulative activity of >600 mCi or 22 GBq I 131, with the last dose administered at least 6 months prior to study entry. The median cumulative RAI activity administered prior to study entry was 350 mCi (12.95 GBq).

A statistically significant prolongation in PFS was demonstrated in LENVIMA-treated patients compared to those receiving placebo (Table 9 and Figure 1). Upon confirmation of progression, 83% of patients that were randomly assigned to placebo crossed over to receive open-label LENVIMA.

14.2 Renal Cell Carcinoma

The efficacy was evaluated in a multicenter, randomized (1:1:1) study (Study 205: NCT01136733), in which 153 patients with advanced or metastatic renal cell carcinoma who have previously received anti-angiogenic therapy received LENVIMA 18 mg orally once daily with everolimus 5 mg orally once daily, LENVIMA 24 mg orally once daily, or everolimus 10 mg orally once daily. Patients were required to have histological confirmation of clear cell RCC and ECOG PS of 0 or 1. Patients were stratified by hemoglobin level (≤13 g/dL for males and ≤11.5 g/dL for females) and corrected serum calcium (≥10 mg/dL vs. <10 mg/dL). The major efficacy outcome measure was investigator-assessed PFS evaluated according to RECIST 1.1.

Of the 101 patients randomized to the LENVIMA with everolimus arm or everolimus arm, 72% were male, the median age was 60 years, 31% were older than 65 years, and 96% were White. Metastases were present in 95% of the patients and unresectable advanced disease was present in 5%. All patients had a baseline ECOG PS of either 0 (54%) or 1 (46%) with similar distribution across these two treatment arms. Memorial Sloan Kettering Cancer Center (MSKCC) favorable, intermediate and poor risk categories were observed respectively, in 24%, 37%, and 39% of patients in the LENVIMA with everolimus arm, and 24%, 38%, and 38% of patients in the everolimus arm.

Efficacy results from Study 205 are summarized in Table 10 and Figures 2 and 3. The treatment effect of the combination on PFS was supported by a retrospective independent review of radiographs with an observed hazard ratio (HR) of 0.43 (95% CI: 0.24, 0.75) compared with the everolimus arm.

Figure 3: Kaplan-Meier Curves for Overall Survival in Study 205
14.3 Hepatocellular Carcinoma

The efficacy of LENVIMA was evaluated in a randomized, open-label, multicenter, international study (REFLECT; NCT01761266) conducted in patients with previously untreated unresectable hepatocellular carcinoma (HCC). The study enrolled adults with Child-Pugh A and Barcelona Clinic Liver Cancer (BCLC) Stage C or B HCC who were ineligible for local liver-directed therapy; had an ECOG PS of 0 or 1; had received no prior systemic therapy for HCC; and had at least one measurable target lesion according to modified RECIST for HCC.

Patients were randomized (1:1) to receive LENVIMA (12 mg for baseline body weight ≥60 kg or 8 mg for baseline body weight <60 kg) orally once daily or sorafenib 400 mg orally twice daily until radiological disease progression or unacceptable toxicity. Randomization was stratified by region (Western vs Asia Pacific), presence of macroscopic portal vein invasion or extrahepatic spread (yes vs no), ECOG PS (0 vs 1), and body weight (<60 kg vs ≥60 kg). The major efficacy outcome measure was overall survival (OS). REFLECT was designed to show the non-inferiority of LENVIMA to sorafenib for OS. Additional efficacy outcome measures were progression-free survival (PFS) and objective response rate (ORR) according to modified RECIST for HCC.

A total of 954 patients were randomized, 478 to the LENVIMA arm and 476 to the sorafenib arm. The demographics of the study population were: median age of 62 years (range: 20 to 88 years); 84% male; 69% Asian and 29% White; 63% ECOG PS of 0; and 69% weighed ≥60 kg. Of the 590 (62%) patients with at least one site of documented distant metastatic disease, 52% had lung metastasis, 45% had lymph node metastasis, and 16% had bone metastasis.

Macroscopic portal vein invasion, extra-hepatic spread, or both were present in 70% of patients. HCC was categorized as Child-Pugh A and BCLC Stage C in 79% and Child-Pugh A and BCLC Stage B in 21% of patients. Seventy-five percent (75%) of patients had radiographic evidence of cirrhosis at baseline. Investigator-documented primary risk factors for the development of HCC were hepatitis B (50%), hepatitis C (23%), alcohol use (6%), other (7%), and unknown (14%).

REFLECT demonstrated that LENVIMA was non-inferior to sorafenib for OS. REFLECT did not demonstrate a statistically significant improvement in OS for patients randomized to LENVIMA as compared to those in the sorafenib arm. LENVIMA was statistically significantly superior to sorafenib for PFS and ORR. Efficacy results are summarized in Table 11 and Figure 4.

16 HOW SUPPLIED/STORAGE AND HANDLING

LENVIMA 4 mg capsules are supplied as hard hypromellose capsules with yellowish-red body and yellowish-red cap, marked in black ink with “Є” on the cap and “LENV 4 mg” on the body.

LENVIMA 10 mg capsules are supplied as hard hypromellose capsules with yellow body and yellowish-red cap, marked in black ink with “Є” on the cap and “LENV 10 mg” on the body.

LENVIMA capsules are supplied in cartons of 6 cards. Each card is a 5-day blister card as follows:

- NDC 62856-724-30: 24 mg, carton with 6 cards NDC 62856-724-05 (ten 10 mg capsules and five 4 mg capsules per card).
- NDC 62856-720-30: 20 mg, carton with 6 cards NDC 62856-720-05 (ten 10 mg capsules per card).
- NDC 62856-718-30: 18 mg, carton with 6 cards NDC 62856-718-05 (five 10 mg capsules and ten 4 mg capsules per card).
- NDC 62856-714-30: 14 mg, carton with 6 cards NDC 62856-714-05 (five 10 mg capsules and five 4 mg capsules per card).
- NDC 62856-712-30: 12 mg, carton with 6 cards NDC 62856-712-05 (fifteen 4 mg capsules per card).
- NDC 62856-710-30: 10 mg, carton with 6 cards NDC 62856-710-05 (five 10 mg capsules per card).
- NDC 62856-708-30: 8 mg, carton with 6 cards NDC 62856-708-05 (ten 4 mg capsules per card).
- NDC 62856-704-30: 4 mg, carton with 6 cards NDC 62856-704-05 (five 4 mg capsules per card).
17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Information).

Hypertension
Advise patients to undergo regular blood pressure monitoring and to contact their health care provider if blood pressure is elevated [see Warnings and Precautions (5.1)].

Cardiac Dysfunction
Advise patients that LENVIMA can cause cardiac dysfunction and to immediately contact their healthcare provider if they experience any clinical symptoms of cardiac dysfunction [see Warnings and Precautions (5.2)].

Arterial Thrombotic Events
Advise patients to seek immediate medical attention for new onset chest pain or acute neurologic symptoms consistent with myocardial infarction or stroke [see Warnings and Precautions (5.3)].

Hepatotoxicity
Advise patients that they will need to undergo laboratory tests to monitor liver function and to report any new symptoms indicating hepatic toxicity or failure [see Warnings and Precautions (5.4)].

Proteinuria and Renal Failure/Impairment
Advise patients that they will need to undergo regular laboratory tests to monitor kidney function and protein in the urine [see Warnings and Precautions (5.5, 5.6)].

Diarrhea
Advise patients when to start standard anti-diarrheal therapy and to maintain adequate hydration. Advise patients to contact their healthcare provider if they are unable to maintain adequate hydration [see Warnings and Precautions (5.7)].

Fistula Formation and Gastrointestinal Perforation
Advise patients that LENVIMA can increase the risk of fistula formation or gastrointestinal perforation and to seek immediate medical attention for severe abdominal pain [see Warnings and Precautions (5.8)].

QTc Interval Prolongation
Advise patients who are at risk for QTc prolongation that they will need to undergo regular ECGs. Advise all patients that they will need to undergo laboratory tests to monitor electrolytes [see Warnings and Precautions (5.9)].

Hypocalcemia
Advise patients of the risks of hypocalcemia, that they will need to undergo laboratory tests to monitor calcium levels, and the potential requirement for calcium supplementation [see Warnings and Precautions (5.10)].
Reversible Posterior Leukoencephalopathy Syndrome

Advise patients of the signs and symptoms of RPLS and to contact their healthcare provider for new onset or worsening neurological function [see Warnings and Precautions (5.11)].

Hemorrhagic Events

Advise patients that LENVIMA can increase the risk for bleeding and to contact their healthcare provider for bleeding or symptoms of severe bleeding [see Warnings and Precautions (5.12)].

Wound Healing Complications

Advise patients that LENVIMA can increase the risk of wound healing complications. Advise patients to inform their healthcare provider of any planned surgical procedure [see Warnings and Precautions (5.14)].

Embryo-Fetal Toxicity

Advise females of reproductive potential of the potential risk to a fetus and to inform their healthcare provider of a known or suspected pregnancy [see Warnings and Precautions (5.15), Use in Specific Populations (8.1)].

Advise females of reproductive potential to use effective contraception during treatment with LENVIMA and for at least 30 days after the last dose [see Use in Specific Populations (8.3)].

Lactation

Advise women to discontinue breastfeeding during treatment with LENVIMA and for at least 1 week after the last dose [see Use in Specific Populations (8.2)].

PATIENT INFORMATION
LENVIMA® (lehn-veema)
(lenvatinib)
capsules

What is LENVIMA?
LENVIMA is a prescription medicine that is used to treat certain kinds of cancer.
- LENVIMA is used by itself to treat differentiated thyroid cancer (DTC), a type of thyroid cancer that can no longer be treated with radioactive iodine and is progressing.
- LENVIMA is used along with another medicine called everolimus to treat advanced renal cell carcinoma (RCC), a type of kidney cancer, after one course of treatment with another anti-cancer medicine.
- LENVIMA is used by itself as the first treatment for a type of liver cancer called hepatocellular carcinoma (HCC) when it cannot be removed by surgery.

It is not known if LENVIMA is safe and effective in children.

Before you take LENVIMA, tell your healthcare provider about all of your medical conditions, including if you:
- have high blood pressure
- have heart problems
- have a history of blood clots in your arteries (type of blood vessel), including stroke, heart attack, or change in vision
- have or have had liver or kidney problems
- have a history of a tear (perforation) in your stomach or intestine, or an abnormal connection between two or more body parts (fistula)
- have headaches, seizures, or vision problems
- have any bleeding problems
- are pregnant or plan to become pregnant. LENVIMA can harm your unborn baby.

Females who are able to become pregnant:
- Your healthcare provider should do a pregnancy test before you start treatment with LENVIMA.
- You should use an effective method of birth control during treatment with LENVIMA and for at least 30 days after the last dose of LENVIMA. Talk with your healthcare provider about birth control methods you can use during this time. Tell your healthcare provider right away if you become pregnant or think you are pregnant during treatment with LENVIMA.
- are breastfeeding or plan to breastfeed. It is not known if LENVIMA passes into your breast milk. Do not breastfeed during treatment with LENVIMA and for at least 1 week after the last dose.

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements.
Know the medicines you take. Keep a list of your medicines to show to your healthcare provider and pharmacist when you get a new medicine.
How should I take LENVIMA?

- Take LENVIMA exactly as your healthcare provider tells you to take it.
- Your healthcare provider will tell you how much LENVIMA to take and when to take it. Your healthcare provider may change your dose during treatment, stop treatment for some time, or completely stop treatment with LENVIMA if you have side effects.
- Take LENVIMA 1 time each day at the same time, with or without food.
- If you miss a dose of LENVIMA, take it as soon as you remember. If your next dose is due within 12 hours, skip the missed dose and take the next dose at your regular time.
- If you cannot swallow LENVIMA capsules whole:
  - Use a medicine cup to measure about one tablespoon of water or apple juice and place into a small glass.
  - Place the LENVIMA capsules into the small glass without breaking or crushing them.
  - Leave the capsules in the liquid for at least 10 minutes.
  - Stir the contents of the glass for at least 3 minutes.
  - Drink the mixture. After drinking, rinse the glass with a small amount of additional water or apple juice and swallow the liquid.
- If you take too much LENVIMA, call your healthcare provider or go to the nearest hospital emergency room right away.

What are the possible side effects of LENVIMA?

LENVIMA may cause serious side effects, including:

- **High blood pressure (hypertension).** High blood pressure is a common side effect of LENVIMA and can be serious. Your blood pressure should be well controlled before you start taking LENVIMA. Your healthcare provider should check your blood pressure regularly during treatment with LENVIMA. If you develop blood pressure problems, your healthcare provider may prescribe medicine to treat your high blood pressure, lower your dose of LENVIMA, or stop your treatment with LENVIMA.
- **Heart problems.** LENVIMA can cause serious heart problems that may lead to death. Call your healthcare provider right away if you get symptoms of heart problems, such as shortness of breath or swelling of your ankles.
- **Problem with blood clots in your blood vessels (arteries).** Get emergency medical help right away if you get any of the following symptoms:
  - Severe chest pain or pressure
  - Pain in your arms, back, neck or jaw
  - Shortness of breath
  - Numbness or weakness on one side of your body
  - Trouble talking
  - Sudden severe headache
  - Sudden vision changes
- **Liver problems.** LENVIMA may cause liver problems that may lead to liver failure and death. Your healthcare provider will check your liver function before and during treatment with LENVIMA. Tell your healthcare provider right away if you have any of the following symptoms:
  - Your skin or the white part of your eyes turns yellow (jaundice)
  - Dark "tea colored" urine
  - Light-colored bowel movements (stools)
  - Feeling drowsy, confused or loss of consciousness
- **Kidney problems.** Kidney failure, which can lead to death, has happened with LENVIMA treatment. Your healthcare provider should do regular blood tests to check your kidneys.
- **Increased protein in your urine (proteinuria).** Proteinuria is a common side effect of LENVIMA and can be serious. Your healthcare provider should check your urine for protein before and during your treatment with LENVIMA. If you develop protein in your urine, your healthcare provider may decrease your dose of LENVIMA or stop your treatment.
- **Diarrhea.** Diarrhea is a common side effect of LENVIMA and can be serious. If you get diarrhea, ask your healthcare provider about what medicines you can take to treat your diarrhea. It is important to drink more water when you get diarrhea. Tell your healthcare provider or go to the emergency room, if you are unable to drink enough liquids and your diarrhea is not able to be controlled.
- **An opening in the wall of your stomach or intestines (perforation) or an abnormal connection between two or more body parts (fistula).** Get emergency medical help right away if you have severe stomach (abdomen) pain.
changes in the electrical activity of your heart called QT prolongation. QT prolongation can cause irregular heartbeats that can be life threatening. Your healthcare provider will do blood tests before and during your treatment with LENVIMA to check the levels of potassium, magnesium, and calcium in your blood, and may check the electrical activity of your heart with an ECG.

low levels of blood calcium (hypocalcemia). Your healthcare provider will check your blood calcium levels during treatment with LENVIMA and may tell you to take a calcium supplement if your calcium levels are low.

a condition called Reversible Posterior Leukoencephalopathy Syndrome (RPLS). Call your healthcare provider right away if you get: severe headache, seizures, weakness, confusion, or blindness or change in vision.

bleeding. LENVIMA may cause serious bleeding problems that may lead to death. Tell your healthcare provider if you have any signs or symptoms of bleeding during treatment with LENVIMA, including:

- severe and persistent nose bleeds
- vomiting blood
- red or black (looks like tar) stools
- blood in your urine
- coughing up blood or blood clots
- heavy or new onset vaginal bleeding

change in thyroid hormone levels. You may have changes in your thyroid hormone levels when taking LENVIMA. Your healthcare provider may need to change your dose of thyroid medicine while you are taking LENVIMA. Your healthcare provider should check your thyroid hormone levels before starting and every month during treatment with LENVIMA.

wound healing problems. If you need to have a surgical procedure, tell your healthcare provider that you are taking LENVIMA. LENVIMA should be stopped until your wound heals.

The most common side effects of LENVIMA in people treated for thyroid cancer include:

- tiredness
- joint and muscle pain
- decreased appetite
- weight loss
- nausea
- mouth sores
- headache
- vomiting
- rash, redness, itching, or peeling of your skin on your hands and feet
- stomach (abdomen) pain
- hoarseness

The most common side effects of LENVIMA in people treated for kidney cancer include:

- tiredness
- joint and muscle pain
- decreased appetite
- vomiting
- nausea
- mouth sores
- swelling in your arms and legs
- cough
- stomach (abdomen) pain
- trouble breathing
- rash
- weight loss
- bleeding

The most common side effects of LENVIMA in people treated for liver cancer include:

- tiredness
- decreased appetite
- joint and muscle pain
- weight loss
- stomach (abdomen) pain
- rash, redness, itching, or peeling of your skin on your hands and feet
- hoarseness
- bleeding
- change in thyroid hormone levels
- nausea

LENVIMA may cause fertility problems in males and females. Talk to your healthcare provider if this is a concern for you.

These are not all the possible side effects of LENVIMA.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store LENVIMA?

- Store LENVIMA at room temperature, between 68°F to 77°F (20°C to 25°C).

Keep LENVIMA and all medicines out of the reach of children.
**General information about the safe and effective use of LENVIMA.**

Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. Do not use LENVIMA for a condition for which it was not prescribed. Do not give LENVIMA to other people, even if they have the same symptoms you have. It may harm them. You can ask your healthcare provider or pharmacist for information about LENVIMA that is written for health professionals.

**What are the ingredients in LENVIMA?**

**Active ingredient:** lenvatinib

**Inactive ingredients:** calcium carbonate, mannitol, microcrystalline cellulose, hydroxypropylcellulose, low-substituted hydroxypropylcellulose, and talc.

**The capsule shell contains:** titanium dioxide, ferric oxide yellow, and ferric oxide red. The printing ink contains shellac, black iron oxide, potassium hydroxide, and propylene glycol.
